SPORTS SURFACING REPAIR & MAINTENANCE

SportFlex Standard

This system is good for new installs or for resurfacing areas with little to no cracking. Minor cracking is repaired with a super bonding cementitious compound. The surface is coated with a high-grade durable and wear resistant color coating infused with slip resistance.

Great for resurfacing of minimally damaged areas.

SportFlex Plus

Cracking is repaired with a super bonding cementitious compound. An acrylic-based emulsion resurfacer is applied to maintain expansionary integrity and smoothing out rough asphalt or concrete surfaces. The surface is then coated with a wear-resistant, sand textured emulsion consisting of high quality pigments and polymers, producing a consistent speed of play for every court.

Great for new or resurfacing of courts showing typical cracking and wear patterns.

SportFlex Ultra

Cracking is repaired with a super bonding cementitious compound or rubber compound. A 1/2" - 3/4" layer of TPV or EPDM colored granules is hand-troweled over the prepared surface. The rubber overlay provides slip resistance, increased flexibility and attenuation, while providing an efficient and aesthetically beautiful surface for court play.

Great for new or resurfacing of minimally damaged areas when extra attenuation is desired.
